

# Package ‘birdproofr’

February 3, 2019

**Title** Bird Banding Data Validator

**Version** 1.0.2

**Description** birdproofr is a package of R tools for bird banding data validation under a set of rules written by Heidi Ware Carlisle, Intermountain Bird Observatory. The validator can be ran as a Shiny app for convenience, which includes utilities for viewing and downloading flagged data. Individual attributes can also be validated through function calls from the R console - please see IBO ruleset. The current birdproofr build has been updated for Fall 2018 banding. Support for a hummingbird ruleset is planned.

**Depends** R (>= 3.5.0)

**Imports** shiny (>= 1.2.0), dplyr (>= 0.7.0), shinycssloaders (>= 0.2.0), shinythemes (>= 1.1.0), shinyWidgets (>= 0.4.0)

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 6.1.1

## Index 28

---

clean_df	<i>Cleans bird data frame before validating, e.g. for mystery whitespace</i>
----------	--

---

### Description

Cleans bird data frame before validating, e.g. for mystery whitespace

### Usage

```
clean_df(df)
```

### Arguments

df	bird data frame
----	-----------------

### Value

cleaned df

---

run_birdproofr_app	<i>Runs birdproofr Shiny app</i>
--------------------	----------------------------------

---

**Description**

Runs birdproofr Shiny app

**Usage**

```
run_birdproofr_app()
```

---

validate_age	<i>Validate age column. Acceptable ages are: 0,1,2,4,5,6 –flag any records with blank age</i>
--------------	---

---

**Description**

Validate age column. Acceptable ages are: 0,1,2,4,5,6 –flag any records with blank age

**Usage**

```
validate_age(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with age issues

---

validate_age_bp_cp	<i>Check that age and BP/CP match. Age 2, 4, and 0 should always have 0 for both BP and CP</i>
--------------------	--

---

**Description**

Check that age and BP/CP match. Age 2, 4, and 0 should always have 0 for both BP and CP

**Usage**

```
validate_age_bp_cp(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with age/BP/CP issues

---

validate_age_ffmolt	<i>Validate age-ffmolt combinations. Blanks are okay, and can match with any age. Refer to table on rules page</i>
---------------------	--

---

### Description

Validate age-ffmolt combinations. Blanks are okay, and can match with any age. Refer to table on rules page

### Usage

```
validate_age_ffmolt(df)
```

### Arguments

df	bird data frame
----	-----------------

### Value

data frame of rows with age/ffmolt issues

---

validate_age_ffwear	<i>Validate age-ffwear combinations.</i>
---------------------	--

---

### Description

0 or 1 FF wear is highly suspicious for age 5 and 6. Flag all these records Sometimes 0 FF wear is normal if paired with S FF molt, but then micro-ageing is suspect, so we should flag the record either way, maybe with a message FF wear and age combination unlikely. Check this record

### Usage

```
validate_age_ffwear(df)
```

### Arguments

df	bird data frame
----	-----------------

### Details

2+ FF wear is suspicious for age 4—add message age and FF wear combination unlikely

4+ is suspicious for age 2—add unlikely message

### Value

data frame of rows with age/ffwear issues

---

validate_age_ha	<i>Validate age-how aged combinations</i>
-----------------	---

---

**Description**

Validate age-how aged combinations

**Usage**

```
validate_age_ha(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with age/how aged issues

---

validate_age_hs	<i>Validate age-how sexed combinations</i>
-----------------	--

---

**Description**

Validate age-how sexed combinations

**Usage**

```
validate_age_hs(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with age/how sexed issues

---

validate_age_skull	<i>Validate age and skull combinations. Allowable values for skull 0-6, 8,9, blank. Flag all values in the skull column that don't match these</i>
--------------------	--

---

**Description**

Validate age and skull combinations. Allowable values for skull 0-6, 8,9, blank. Flag all values in the skull column that don't match these

**Usage**

```
validate_age_skull(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with age/skull issues

---

validate_all	<i>Validate all columns, then store issues as a data frame</i>
--------------	--

---

**Description**

Validate all columns, then store issues as a data frame

**Usage**

```
validate_all(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

issues data frame

---

validate_bandcode	<i>Validate band code. Make sure there are no blanks. Make sure the only values used are 1,R,4,5,8,N,U.</i>
-------------------	---

---

**Description**

Validate band code. Make sure there are no blanks. Make sure the only values used are 1,R,4,5,8,N,U.

**Usage**

```
validate_bandcode(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with band code issues

---

validate_bandcode_species	<i>Validate band code-species combinations. Make sure 4 and 8 are only used for species codes BADE and BALO</i>
---------------------------	---

---

**Description**

Validate band code-species combinations. Make sure 4 and 8 are only used for species codes BADE and BALO

**Usage**

```
validate_bandcode_species(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with band code/species issues

---

`validate_bandcode_status`

*Validate bandcode-status combinations. Any bird with code U has status 000 as valid.*

---

**Description**

Validate bandcode-status combinations. Any bird with code U has status 000 as valid.

**Usage**

```
validate_bandcode_status(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with bandcode/status issues

---

`validate_bandsize`

*Validate band size. Make sure there are no blanks. Make sure the only values used are 0A, 0, 1, 1B, 1A, 1C, 2, 3, 3A, 3B*

---

**Description**

Validate band size. Make sure there are no blanks. Make sure the only values used are 0A, 0, 1, 1B, 1A, 1C, 2, 3, 3A, 3B

**Usage**

```
validate_bandsize(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with band size issues

---

`validate_bandsize_disp`*Validate band size-disp combinations*

---

**Description**

Validate band size-disp combinations

**Usage**

```
validate_bandsize_disp(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with band size/disp issues

---

`validate_bmlt`*Validate body molt. Allowable values: 0-4, blank*

---

**Description**

Validate body molt. Allowable values: 0-4, blank

**Usage**

```
validate_bmlt(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with body molt issues

---

validate_bp	<i>Validate BP (0-5, blank okay)</i>
-------------	--------------------------------------

---

**Description**

Validate BP (0-5, blank okay)

**Usage**

```
validate_bp(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with BP issues

---

validate_bp_hs	<i>Validate how sexed and BP for females. If sexed by BP, BP value cannot be blank or 0</i>
----------------	---

---

**Description**

Validate how sexed and BP for females. If sexed by BP, BP value cannot be blank or 0

**Usage**

```
validate_bp_hs(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with BP/how sexed issues for females

---

validate_captime	<i>Validate cap time. Allowed values include: 650 to 1300. Flag all other values. Other values may happen only if there is a note, sometimes songbirds are caught during owls, hawk trapping, etc. All values should end in 0's</i>
------------------	---

---

**Description**

Validate cap time. Allowed values include: 650 to 1300. Flag all other values. Other values may happen only if there is a note, sometimes songbirds are caught during owls, hawk trapping, etc. All values should end in 0's

**Usage**

```
validate_captime(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with cap time issues

---

validate_cp	<i>Validate CP (0-3 allowed, blank okay)</i>
-------------	--

---

**Description**

Validate CP (0-3 allowed, blank okay)

**Usage**

```
validate_cp(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with CP issues

---

validate_cp_hs	<i>Validate how sexed and CP for males. If sexed by CL, CP value cannot be blank, 0, or 1 (i.e. CP must = 2 or 3)</i>
----------------	---

---

**Description**

Validate how sexed and CP for males. If sexed by CL, CP value cannot be blank, 0, or 1 (i.e. CP must = 2 or 3)

**Usage**

```
validate_cp_hs(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with CP/how sexed issues for males

---

validate_day	<i>Validate day. Valid: 1-31. no blanks except for BADE/BALO</i>
--------------	--

---

**Description**

Validate day. Valid: 1-31. no blanks except for BADE/BALO

**Usage**

```
validate_day(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with day issues

---

validate_day_species	<i>Validate day-species combinations</i>
----------------------	--

---

**Description**

Validate day-species combinations

**Usage**

```
validate_day_species(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with day/species issues

---

validate_disp	<i>Validate disp. Allowable values include: M,O,I,S,E,D,T,W,B,L,P, blank</i>
---------------	--

---

**Description**

Validate disp. Allowable values include: M,O,I,S,E,D,T,W,B,L,P, blank

**Usage**

```
validate_disp(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with disp issues

---

validate_disp_status	<i>Validate disp-status combinations. Any bird with a letter in disp should have a note explaining why and the status should say 500</i>
----------------------	--

---

### Description

Validate disp-status combinations. Any bird with a letter in disp should have a note explaining why and the status should say 500

### Usage

```
validate_disp_status(df)
```

### Arguments

df	bird data frame
----	-----------------

### Value

data frame of rows with disp/status issues

---

validate_ey	<i>Validate EY in how aged. EY in the How Aged columns should only be used for species codes SPTO, DOWO, NOFL, RSFL, HAWO, DEJU, ORJU, SCJU, UDEJ –flag any other species that use this with note, Check in Pyle to confirm that this species can be aged by eye color</i>
-------------	--

---

### Description

Validate EY in how aged. EY in the How Aged columns should only be used for species codes SPTO, DOWO, NOFL, RSFL, HAWO, DEJU, ORJU, SCJU, UDEJ –flag any other species that use this with note, Check in Pyle to confirm that this species can be aged by eye color

### Usage

```
validate_ey(df)
```

### Arguments

df	bird data frame
----	-----------------

### Value

data frame of rows with EY issues

---

validate_fat	<i>Validate fat 0-5, blank are allowed. 6 fat is okay but only if there's a note</i>
--------------	--

---

**Description**

Validate fat 0-5, blank are allowed. 6 fat is okay but only if there's a note

**Usage**

```
validate_fat(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with fat issues

---

validate_ffmolt	<i>Validate flight feather molt. Allowable values: N, S, J, A, blank</i>
-----------------	--

---

**Description**

Validate flight feather molt. Allowable values: N, S, J, A, blank

**Usage**

```
validate_ffmolt(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with ffmolt issues

---

validate_ffwear	<i>Validate flight feather wear. Allowable values: 0-5, blank</i>
-----------------	---

---

### Description

Validate flight feather wear. Allowable values: 0-5, blank

### Usage

```
validate_ffwear(df)
```

### Arguments

df	bird data frame
----	-----------------

### Value

data frame of rows with ffwear issues

---

validate_ha_ffmolt	<i>Validate how aged-ffmolt combinations. If "how aged" says MR, FF molt must be S or J (can't be blank, N, or A)</i>
--------------------	---

---

### Description

Validate how aged-ffmolt combinations. If "how aged" says MR, FF molt must be S or J (can't be blank, N, or A)

### Usage

```
validate_ha_ffmolt(df)
```

### Arguments

df	bird data frame
----	-----------------

### Value

data frame of rows with how aged/ffmolt issues

---

validate_ha_ffwear	<i>Validate how aged-ffwear combinations. If "how aged" says FF then FF Wear cannot be blank</i>
--------------------	--

---

**Description**

Validate how aged-ffwear combinations. If "how aged" says FF then FF Wear cannot be blank

**Usage**

```
validate_ha_ffwear(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with how aged/ffwear issues

---

validate_ha_ha2	<i>Validate how aged-how aged 2 combinations</i>
-----------------	--

---

**Description**

Validate how aged-how aged 2 combinations

**Usage**

```
validate_ha_ha2(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with ha/ha2 issues

---

validate_ha_skull	<i>Validate how aged and skull combinations</i>
-------------------	---

---

**Description**

Validate how aged and skull combinations

**Usage**

```
validate_ha_skull(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with how aged/skull issues

---

validate_hs_hs2	<i>Validate how sexed-how sexed 2 combinations</i>
-----------------	--

---

**Description**

Validate how sexed-how sexed 2 combinations

**Usage**

```
validate_hs_hs2(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with hs/hs2 issues

---

validate_location	<i>Validate location. Make sure there are no blanks</i>
-------------------	---

---

**Description**

Validate location. Make sure there are no blanks

**Usage**

```
validate_location(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with location issues

---

validate_month	<i>Validate month. Valid: 2-11. No blanks except for BADE BALO</i>
----------------	--

---

**Description**

Validate month. Valid: 2-11. No blanks except for BADE BALO

**Usage**

```
validate_month(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with month issues

---

`validate_month_species`*Validate month-species combinations*

---

**Description**

Validate month-species combinations

**Usage**

```
validate_month_species(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with month/species issues

---

`validate_muscle`*Validate muscle. 2,5,3,4,5, blank allowed. 1 or 2 are allowed but MUST have a note, otherwise it's likely a type-o (check hard copy)*

---

**Description**

Validate muscle. 2,5,3,4,5, blank allowed. 1 or 2 are allowed but MUST have a note, otherwise it's likely a type-o (check hard copy)

**Usage**

```
validate_muscle(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with muscle issues

---

validate_net	<i>Validate net. Allowable values: 1-12, blank. Some exceptions allowed with a note, e.g. owl nets but we should flag those exceptions anyway to make sure someone checks them</i>
--------------	--

---

**Description**

Validate net. Allowable values: 1-12, blank. Some exceptions allowed with a note, e.g. owl nets but we should flag those exceptions anyway to make sure someone checks them

**Usage**

```
validate_net(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with net issues

---

validate_notes	<i>Validate notes. Check that notes that mention either flat flies, or mites, lice, louse, mite have a Y for parasite column</i>
----------------	--

---

**Description**

Validate notes. Check that notes that mention either flat flies, or mites, lice, louse, mite have a Y for parasite column

**Usage**

```
validate_notes(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with notes issues

---

validate_parasites	<i>Validate parasites. If there is a Y in the parasites column there needs to be a note</i>
--------------------	---

---

**Description**

Validate parasites. If there is a Y in the parasites column there needs to be a note

**Usage**

```
validate_parasites(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with parasite column issues

---

validate_sex	<i>Validate sex column. Acceptable values= M F U—flag all the blanks</i>
--------------	--

---

**Description**

Validate sex column. Acceptable values= M F U—flag all the blanks

**Usage**

```
validate_sex(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with sex issues

---

validate_sex_hs	<i>Validate how sexed and sex combinations. Allowable values include: PL, EY, FF, MB, PC, LP, NL, MR, SK, TS, (blank only in second field, or for age 0)</i>
-----------------	--

---

**Description**

F: PL,BP,WL—first HS field can NOT be blank

**Usage**

```
validate_sex_hs(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Details**

M: PL,CL,WL—first HS field can NOT be blank

U: always blank, or IC, If not blank, check hard copy for errors or white-out. If sex is whited out, leave as U. Check fields above and below to make sure there's not a data entry error

**Value**

data frame of rows with hs/sex issues

---

validate_species	<i>Validate species column. Refer to master species list to update</i>
------------------	--

---

**Description**

Validate species column. Refer to master species list to update

**Usage**

```
validate_species(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with species issues

---

validate_status	<i>Validate status. Allowable values for new bands: 300, 500. Blank is NOT valid</i>
-----------------	--

---

**Description**

Validate status. Allowable values for new bands: 300, 500. Blank is NOT valid

**Usage**

```
validate_status(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with status issues

---

validate_status_500	<i>Validate status 500s. ALL status 500's MUST have text in the note column and a letter in the disp column i.e. Note and Disp columns cannot be blank</i>
---------------------	--

---

**Description**

Validate status 500s. ALL status 500's MUST have text in the note column and a letter in the disp column i.e. Note and Disp columns cannot be blank

**Usage**

```
validate_status_500(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with status 500 issues

---

validate_tail	<i>Validate tail. Check if tail is below 30 or above 200</i>
---------------	--

---

**Description**

Validate tail. Check if tail is below 30 or above 200

**Usage**

```
validate_tail(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with tail issues

---

validate_weight	<i>Validate weight. Flag anything under 5 but GCKI or BCHU RUHU CAHU okay or over 200 raptors would be a rare exception</i>
-----------------	---

---

**Description**

Validate weight. Flag anything under 5 but GCKI or BCHU RUHU CAHU okay or over 200 raptors would be a rare exception

**Usage**

```
validate_weight(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with weight issues

---

validate_wing	<i>Validate wing. Check if wing is below 30 or above 200</i>
---------------	--

---

**Description**

Validate wing. Check if wing is below 30 or above 200

**Usage**

```
validate_wing(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with wing issues

---

validate_year	<i>Validate year. No blanks. Allowable values are any valid year between 1997 and current year except BADE BALO</i>
---------------	---

---

**Description**

Validate year. No blanks. Allowable values are any valid year between 1997 and current year except BADE BALO

**Usage**

```
validate_year(df)
```

**Arguments**

df	bird data frame
----	-----------------

**Value**

data frame of rows with year issues

---

validate\_year\_species    *Validate year-species combinations*

---

**Description**

Validate year-species combinations

**Usage**

```
validate_year_species(df)
```

**Arguments**

df                      bird data frame

**Value**

data frame of rows with year/species issues
